# Outline

- 1. SAT, max-SAT, frustration, non-linear constraints, and sampling
- 2. Spectral Mapping with Ising Spins
  - Arbitrary max-SAT on the chimera graph
  - Aside: Another way to do parity checks
  - A better mapping
- 3. Applications
  - Classical communications: turbo code decoder

Particle simulation

### Penalty formalism for SAT

Hamiltonian to implement clauses:

$$H(a) = \sum_{i} Pen(\{a_{i}^{(l)}\})$$
$$a_{i}^{(l)} \in \{a_{1}, a_{2}, a_{2}, ...\} \cup \{\neg a_{1}, \neg a_{2}, \neg a_{3}, ...\}$$
$$Pen(\{a^{(l)}\}) \begin{cases} \geq g & a_{i}^{(l)} = 0, \ \forall i \\ = 0 & \text{otherwise.} \end{cases}$$

- Violating any clause gives an energy of at least g
- zero energy state satisfies all clauses
- Lowest energy state not meaningful if cannot satisfy simultaneously

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

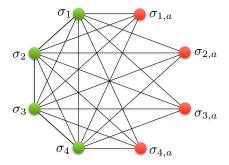

Alternate approach: penalize every clause violation equally

$$Spec(\{a^{(l)}\}) = \begin{cases} g & a_i^{(l)} = 0, \forall i \\ 0 & \text{otherwise.} \end{cases}$$
$$H(a) = \sum_i Spec(\{a_i^{(l)}\}) = N(a)g$$

- N(a) is the number of clauses violated by bitstring a
- minimum energy bitstring satisfies the maximum number of clauses
- ▶ Boltzmann distribution can be used for maximum entropy inference → will come back to this

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Making clauses using the Ising model (arXiv:1604.00651)

- couple all logical bits to each other and to all ancillas
- bias ancillas so that ancilla 1 will flip if 1 or more logical bits are up, 2 if 2 etc...
- ancilla couplings and couplings between bits cancel, fields on ancillas can assign arbitrary penalties
- ► single bit sector corresponds to clause on previous slide, can also create parity checks (⊕ clauses) arXiv:1603.09521

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへ⊙

### simple example

Logical bit values	Ancilla values	Е
1111	0000	0
0111, 1011, 1101, 1110	0001	0
0011, 0101, 0110, 1001, 1010, 1100	0011	0
1000, 0100, 0010, 0001	0111	0
0000	1111	g

- ► Example in which applying a field on the last ancilla applies an OR clause q<sub>1</sub> ∨ q<sub>2</sub> ∨ q<sub>3</sub> ∨ q<sub>4</sub>
- ► Applying to first ancilla will instead apply AND q<sub>1</sub> ∧ q<sub>2</sub> ∧ q<sub>3</sub> ∧ q<sub>4</sub>
- ▶ Alternating ancilla fields can apply XOR  $q_1 \oplus q_2 \oplus q_3 \oplus q_4$
- see: arXiv:1604.00651 for Hamiltonian details

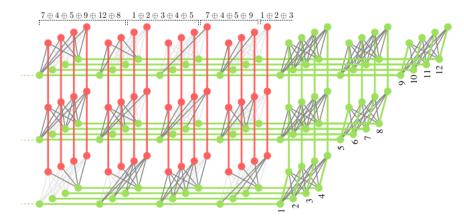

# Quick Aside: Non-linear Constraints

Logical bit values	Ancilla values	Е
1111	0000	E <sub>4</sub>
0111, 1011, 1101, 1110	0001	E <sub>3</sub>
0011, 0101, 0110, 1001, 1010, 1100	0011	E <sub>2</sub>
1000, 0100, 0010, 0001	0111	$E_1$
0000	1111	E <sub>0</sub>

Energies can be assigned arbitrarily: can implement non-linear constraints on the number of ones

# max-SAT on the chimera

 Use Choi complete graph minor embedding plus rows of ancillas to implement clauses arXiv:1604.00651

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・

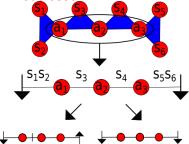

Conceptually nice to demonstrate direct mapping but....

- high connectivity makes mapping inefficient
- Some clauses, ex. (a₁ ∨ a₂) ∧ (a₃ ∨ a₄) ∧ ... require an exponentially growing number of ancillas

I will show how both these problems can be addressed after a brief (1-slide) aside

# one slide aside: another way of implementing parity checks

Proposed by other authors in arXiv:1604.02359, alternate formulation in arXiv:1603.08554

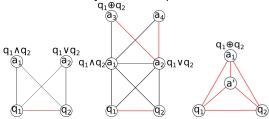

Triangles  $\rightarrow$  effective 3 body coupling gadgets, s  $\rightarrow$  logical bit,s a  $\rightarrow$  ancillas

- parity of {s} is even → no domain wall (unique), odd → domain wall (degenerate)
- ► degeneracy can be removed by weakening any of the 3 local gadgets, → necessary for thermal sampling

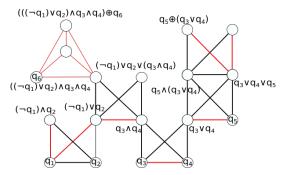

# Ancilla representations for AND ( $\land$ ), OR ( $\lor$ ), and XOR ( $\oplus$ ) on 2 bits

Using the methods of arXiv:1604.00651, single 'indicator' bit corresponds to result of any of these operations

- ► ∧ and ∨ 'mark' single states, so single bits act as 'indicators' for these clauses
- ► second copy of gadget Hamiltonian needed to create single bit corresponding to ⊕,
- $\blacktriangleright$  alternatively 3 bit gadget acts as indicator for  $\oplus$

# Chaining 2 bit Hamiltonians to make more complex clauses

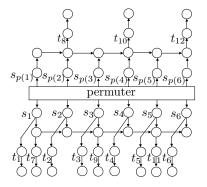

- Apply gadget to 'indicator' ancillas to create more complex clauses
- Fields on indicators enforce clauses
- ► Any clause which can be efficiently written using ∧, ∨, ⊕, ¬, and parenthesis can be implemented efficiently

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

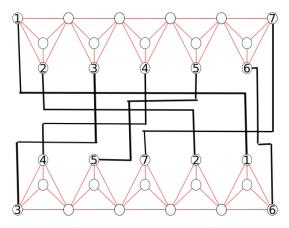

Does not require full connectivity

# Example: Classical Decoding, Turbo code implementation

- Interleaved convolution code: apply strings of ⊕ of even length on bits (s<sub>1</sub> ⊕ s<sub>2</sub>), (s<sub>1</sub> ⊕ s<sub>2</sub> ⊕ s<sub>3</sub> ⊕ s<sub>4</sub>) ...
- ▶ odd length strings of  $\oplus$  applied to random permutation  $(s_{p(1)}), (s_{p(1)} \oplus s_{p(2)} \oplus s_{p(3)}) \dots$
- approaches Shanon limit for large block length

# Turbo code decoder using minor embedding

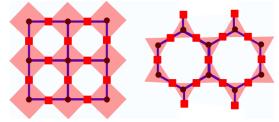

- Black lines  $\rightarrow$  embedding bonds
- red lines  $\rightarrow$  ancilla couplings
- note similarity to ideas presented in arXiv:1603.08554v2

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへ⊙

## Application: Particle Simulation

Higher dimensional analogue of 1-D domain walls using high locality operators, red squares  $\rightarrow$  spins, pink polyhedra  $\rightarrow$  couplers, circles  $\rightarrow$  particle sites, lines  $\rightarrow$  allowed hops

$$H_{particle} = -\frac{m}{2} \sum_{i} \prod_{j \in d_i} \sigma_j^z - \tau \sum_{i} \sigma_i^z - \Delta \sum_{i} \sigma_i^x$$

Can this Hamiltonian be realized perturbatively using our gadget?

Realizing particle simulation Hamiltonian perturbatively

Using our gadget for each coupler What works:

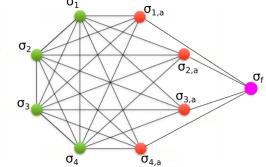

- All logical bit flips occur at 3rd order in perturbation theory (flip 2 ancillas plus bit)
- All transitions go through intermediate states with the same energy

• : bit flips  $(\sigma_i^{\mathsf{x}})$  realized perturbatively with no modifications What Doesn't:

► Second order fluctuations are not the same for every logical state → some energetically favored over others

I will show how to rectify this on next slide

# Matching fluctuation strengths with additional ancillas

'fluctuation control' ancillas (f), coupled to ancillas

$$H_{fc} = \sum_{i} (J_{i,f}(-\sigma_{i,a}^{z} + \sigma_{i,a}^{z}\sigma_{f}^{z}) + |J_{i,f}|\sigma_{f}^{z}) + h_{f}^{0}\sigma_{f}^{z}$$

- $h_f^0 > 0$  no effect on Ising coupling
- $\{J_{i,f}\}$  tuned to control fluctuations
- more than 1 such ancilla can be added

# Conclusions

- Alternate method for mapping problems based on max-SAT formalism
- Individual elements claimed together to realize any clause which can be written efficiently
- Example applications:
  - Classical message decoding: Turbo Code
  - Particle simulation: realize Hamiltonian perturabtively

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <
